

Mast and Tower:

1. Guyed mast (500W to 5kW)

Guyed mast is composed of several segments of steel tubes which are galvanized and spray painted. It is easy to be transported and assembled, especially suitable in the remote area where a crane is not available.

2. Self-supporting Tower (500W to 100kW)

Self-supporting tower is made of fine steel and it is strong enough to resist heavy wind. The surface of the tower is processed with the hot galvanization and spray paint, thus is able to protect the tower against corrosion and rust.

3. Hydraulic Tower (2kW to 30kW)

Thanks to the hydraulic pump system at the foot of the tower, it is easy to set up or lay down the tower just by pressing buttons. It is a wise choice in the remote area where a crane is not available.
